This formed solid metal product poses little or no immediate health or fire hazard.

When product is subjected to welding, burning, melting, sawing, brazing, grinding, or other similar processes, potentially hazardous airborne particulate and fumes may be generated. Avoid inhalation of metal dusts and fumes. Operations having

the potential to generate airborne particulates should be performed in well ventilated areas and, if appropriate, respiratory protection and other personal

state do not present an inhalation, ingestion or contact hazard. However, operations such as burning, welding, sawing, brazing, machining and grinding may result in the following effects if exposures exceed recommended limits.

Primary Entry Routes: Inhalation and skin, if coated. Steel products in the natural

Excessive exposure to high concentrations of dust may cause irritation to the eyes,

Excessive exposure to high concentrations of dust may cause irritation to the eyes

Skin contact with dusts may cause irritation or sensitization, possibly leading

Ingestion of harmful amounts of this product as distributed is unlikely due to its

solid insoluble form. Ingestion of dust may cause nausea and/or vomiting.

Chronic inhalation of excessive concentrations of iron oxide fumes or dusts may result in the development of a benign pneumoconiosis, called siderosis, which is observable as an X-ray change. No physical impairment of lung function

Depending on the concentration and duration of exposure, repeated or prolonged

inhalation may cause inflammation of the respiratory passages, ulcers of the mucous membranes, and possible perforation of the nasal septum. Repeated or

Chronic inhalation of high concentrations to carbon may cause pulmonary

Skin contact with dusts may cause irritation or sensitization, possibly leading to

dermatitis. Repeated or prolonged contact with surface treatments or oil residue may cause skin irritation, dermatitis, ulceration or allergic reactions in sensitized

Chronic exposure to high concentrations of manganese fumes and dusts may

adversely affect the central nervous system with symptoms including languor, sleepiness, weakness, emotional disturbances, spastic gait, mask-like facial expression and paralysis. Animal studies indicate that manganese exposure may

Inhalation of dusts and fumes of ferrophosphorus and phosphorus oxides may

Silicon dusts are a low health risk by inhalation and should be treated as a

Sulfur compounds present in the fumes, may irritate the skin, eyes, lungs and

Aluminum dusts/fines are a low health risk by inhalation and should be treated

Lead is classified among the highly toxic heavy metals. It is a cumulative hazard (accumulates in the bone and body tissue) and is a systemic poison that may affect a variety of organ systems, including the central nervous system, kidneys,

Latent liver dysfunction and gastrointestinal disturbances with pressure in the

The possible presence of chemical surface treatments and oil coatings should be

during handling and welding or other fume activities. Removal of surface coatings

emphysema, etc.) may be adversely affected by any fume or airborne particulate

considered when evaluating potential employee health hazards and exposures

Individuals with chronic respiratory disorders (i.e., asthma, chronic bronchitis,

matter exposure. SARA Potential Hazard Categories: Immediate Acute Health

For over-exposure to airborne fumes and particulate, remove exposed person to

fresh air. If breathing is difficult or has stopped, administer artificial respiration or oxygen as indicated. Seek medical attention promptly. Metal fume fever may be treated by bed rest, and administering a pain and fever reducing medication.

Remove contaminated clothing. Wash affected areas with soap or mild detergent and water. If thermal burn has occurred, flush area with cold water and seek medical attention. If a persistent rash or irritation occurs, seek medical attention

Not a probable route of industrial exposure. However, if ingested, seek medical

Not applicable for solid product. Use extinguishers appropriate for surrounding

At temperatures above the melting point, fumes containing metal oxides and

Do not release runoff from fire control methods to sewers or waterways

Wear a self-contained breathing apparatus (SCBA) with a full facepiece

Not applicable to steel in solid state. For spills involving finely divided particles, clean-up personnel should be protected against contact with eyes and skin. If material is in a dry state, avoid inhalation of dust. Fine, dry material should be removed by vacuuming or wet sweeping methods to prevent spreading of dust. Avoid using compressed air. Do not release into sewers or waterways. Collect material in appropriate, labeled containers for recovery or disposal in

Follow applicable OSHA regulations (29 CFR 1910.120) and all other pertinent

Contact your supplier or a licensed contractor for detailed recommendations.

Operations with the potential for generating high concentrations of airborne particulates should be evaluated and controlled as necessary. Practice good

Use controls as appropriate to minimize exposure to metal fumes and dusts

Provide general or local exhaust ventilation systems to minimize airborne concentrations. Local exhaust ventilation is preferred because it prevents contamination dispersion into the work area by controlling it at its source.

Seek professional advice prior to respirator selection and use. Follow OSHA

For operations which result in elevating the temperature of the product to or above its melting point or result in the generation of airborne particulates, use protective clothing, gloves and safety glasses or goggles as required for welding, burning, sawing, brazing, grinding or machining operations. Protective gloves should be worn as required for welding, burning or handling operations. Where the surface treatments are applied to the product, wear gloves when handling. Do not continue to use gloves or work clothing that has become saturated or soaked through with oil coating. Wash skin that has been exposed

Steel products are stable under normal storage and handling conditions

Will react with strong acids to form hydrogen. Iron oxide dusts in contact with calcium hypochlorite evolve oxygen and may cause an explosion.

Thermal oxidative decomposition of galvanized steel products can produce

fumes containing oxides or zinc, iron and manganese as well as other elements.

The possible presence of chemical surface treatment and coatings should be considered when evaluating potential employee health hazards and exposures

Eye contact with the individual components may cause particulate irritation.

Implantation of iron particles in guinea pig corneas has resulted in rust rings with corneal softening about rust ring. Repeated or prolonged eye contact

Skin contact with the individual dust components may cause physical abrasion,

Inhalation of the individual alloy components has been shown to cause various

during handling and welding or other fume generating activities

Lead; Chromium (in surface passivation treatment, if specified).

No data available for galvanized steel as a whole. However, individual

No data available for galvanized steel as a whole. However, individual components have been found to be absorbed by plants from soil.

Steel scrap should be recycled whenever possible. Product dusts and fumes from processing operations should also be recycled, or classified by a competent environmental professional and disposed of in accordance with

Follow applicable Federal, state or local regulations. Observe safe handling

Galvanized steel is not listed as a hazardous substance for any mode

The product as a whole is not listed. However, individual components of the
